AN 2001441220 MEDLINE

TI Selective estrogen receptor modulation: the search for an ideal hormonal therapy for breast cancer.

AU Dhingra K

SO Cancer investigation, (2001) Vol. 19, No. 6, pp. 649-59. Ref: 67
 Journal code: 8307154. ISSN: 0735-7907.

AB Female hormones, especially estrogens, play an important role in the pathogenesis of breast neoplasms and are a principal determinant of their biological behavior. Endocrine manipulation through medical or surgical means can often lead to objective shrinkage of breast tumors. Tamoxifen, a triphenylethylene estrogen receptor modulator, is currently the most widely used hormonal treatment for breast cancer. It has been conclusively demonstrated to reduce the risk of relapse following definitive local therapy (and systemic chemotherapy, when indicated) of invasive or noninvasive breast cancer. Recently, it has also been shown to reduce the incidence of breast cancer in healthy women who are at high risk of developing the disease. In addition, it can prevent osteoporosis and reduce the risk of fractures in postmenopausal women. However, its use is also complicated by an increased incidence of endometrial hyperplasia/carcinoma, venous thromboembolism, cataracts, and in some cases, emergence of tamoxifen-dependent clones of breast cancer. These side effects (except cataracts) are believed to be related to estrogen-agonist effects of tamoxifen. Newer drugs, which are "pure antiestrogens" or inhibitors of estrogen biosynthesis, are devoid of such estrogen-agonist activity and may not have the liability of many of these side effects. However, these agents would also be expected to lack the potentially beneficial effects of tamoxifen on lipids and skeletal system. The ability of tamoxifen to act as an estrogen-agonist or estrogen-antagonist in a tissue-specific fashion has led to the concept of selective estrogen-receptor modulation. Selective estrogen receptor modulators (SERMs), which are devoid of estrogen-agonist effects on the uterus or breast cancer cells but retain potentially beneficial effects on bones and lipids, have been described as "ideal" SERMs. A number of such compounds are currently being tested. Raloxifene is already approved for prevention of osteoporosis and has potential efficacy for prevention and treatment of breast cancer. An analogue of raloxifene, LY353381, is currently in Phase II clinical trials for treatment of breast cancer, with promising early results. EM800 and CP336156 are other promising ideal SERMs in clinical trials. These compounds may provide better treatment and chemoprevention alternatives for breast cancer as compared to tamoxifen, aromatase inhibitors, and pure antiestrogens. In addition, they may also prove to be useful for the treatment and prevention of prostate cancer as well as for treating benign gynecological diseases such as fibroids and endometriosis. Future laboratory efforts should focus on further broadening the efficacy profile of SERMs (e.g., prevention of Alzheimer's disease and elevation of high-density lipoproteins to improve the likelihood of cardiovascular benefit) and narrowing their side-effect profile (e.g., risk of thromboembolism and hot flashes).

TI Selective estrogen receptor modulation: the search for an ideal hormonal therapy for breast cancer.

TI Tamoxifen to raloxifene and beyond.

AU O'Regan R M; Jordan V C

SO Seminars in oncology, (2001 Jun) Vol. 28, No. 3, pp. 260-73. Ref: 119
Journal code: 0420432. ISSN: 0093-7754.

AB Tamoxifen, a **selective estrogen receptor modulator (SERM)**, is the treatment of choice for all stages of hormone-responsive breast cancer and has been shown to prevent breast cancer in high-risk women. Despite acting as an **antiestrogen** on the breast, tamoxifen has partial estrogenic effects on other target tissues. These partial estrogen agonistic actions produce beneficial effects on bones and the lipid profile in postmenopausal women. However, tamoxifen is associated with an increase in endometrial cancer. Additionally, its antiestrogenic effects in the central nervous system result in **hot flashes** in postmenopausal women. Raloxifene is another SERM approved for the prevention of osteoporosis in postmenopausal women. Like tamoxifen, raloxifene appears to prevent breast cancer in high-risk women and has not, to date, been noted to increase the incidence of endometrial cancer. The Study of Tamoxifen and Raloxifene will compare the effects of the two agents on breast cancer prevention and endometrial cancer risk. A number of new agents are being developed for breast cancer treatment and prevention and osteoporosis prevention. These include other SERMs, selective estrogen receptor downregulators (SERDs), and aromatase inhibitors. It is hoped that one of these new agents will be the ideal agent, acting as an **antiestrogen** on breast and endometrium while having estrogenic effects on bones, the lipid profile, and the central nervous system. Semin Oncol 28:260-273.

TI Raloxifene hydrochloride.

AU Snyder K R; Sparano N; Malinowski J M

SO American journal of health-system pharmacy : AJHP : official journal of the American Society of Health-System Pharmacists, (2000 Sep 15) Vol. 57, No. 18, pp. 1669-75; quiz 1676-8. Ref: 27
Journal code: 9503023. ISSN: 1079-2082.

AB The pharmacology, pharmacokinetics, clinical efficacy, adverse effects, and therapeutic role of raloxifene hydrochloride are reviewed. Raloxifene is a selective estrogen-receptor modulator (SERM) that has been approved for use in the prevention and treatment of osteoporosis in postmenopausal women. A SERM interacts with estrogen receptors, functioning as an agonist in some tissues and an antagonist in other tissues. Because of their unique pharmacologic properties, these agents can achieve the desired effects of estrogen without the possible stimulatory effects on the breasts or uterus. Raloxifene is rapidly absorbed from the gastrointestinal tract and undergoes extensive first-pass glucuronidation. Approximately 60% of a dose is absorbed; however, absolute bioavailability is only 2%. The volume of distribution is 2348 L/kg for a single oral dose of 30-150 mg, and the elimination half-life averages 32.5 hours. In clinical trials in postmenopausal women, raloxifene had an estrogen-like effect on bone turnover and increased bone mineral density. It reduced the risk of fractures in women with osteoporosis. Raloxifene also seemed to reduce the risk of breast cancer and positively influenced blood lipid markers of cardiovascular disease. Raloxifene is generally well tolerated; the most common adverse effects are hot flashes and leg cramps. A serious adverse effect is venous thromboembolism. The recommended dosage is 60 mg/day orally without regard to meals. Ultimately, it will be information on cardiovascular or breast cancer benefits that will determine the future role of raloxifene. Raloxifene is an alternative to traditional hormone replacement therapy for the prevention and treatment of osteoporosis in selected postmenopausal women. More study is needed to verify possible benefits related to heart disease and breast cancer.

TI Selective estrogen receptor modulators (SERMs) in clinical practice.

AU Plouffe L Jr

SO Journal of the Society for Gynecologic Investigation, (2000 Jan-Feb) Vol. 7, No. 1 Suppl, pp. S38-46. Ref: 103
Journal code: 9433806. ISSN: 1071-5576.

AB The objective of this literature review is to familiarize the reader with the clinical data on selective estrogen receptor modulators (SERMs) and antiestrogens currently in use in the US, excluding data on breast effects. Four compounds in the SERM and antiestrogen families are presently in clinical use in the US: clomiphene (CC), tamoxifen (TAM), toremifene (TOR), and raloxifene (RLX). The clinical database on these compounds is among the largest available. Each compound demonstrates a specific profile for its target tissue effects, and this may differ between premenopausal and postmenopausal women. CC is the most widely used agent for ovulation induction. TAM is indicated in the management of breast cancer and for prevention in women at high risk. TAM may have

additional effects on the cardiovascular and skeletal systems. TOR also is used for its effects on breast tissue and may have positive cardiovascular effects. RLX is approved in the management of osteoporosis with data supporting favorable effects on the cardiovascular system and breast tissue. TAM and TOR appear to have stimulatory effects on the uterus and endometrium, whereas RLX is neutral. Few adverse events have been attributed to these agents, with **hot flashes** being the most common one. There appears to be an increased risk of thromboembolic events with continuous use of TAM, TOR, and RLX. SERMs and antiestrogens continue to be studied extensively. Their evolving profiles support key roles for these agents in modern day medicine, particularly in the management of postmenopausal women's health.

TI Characterization of **hot flashes** reported by healthy postmenopausal women receiving raloxifene or placebo during osteoporosis prevention trials.

AU Cohen F J; Lu Y

SO Maturitas, (2000 Jan 15) Vol. 34, No. 1, pp. 65-73.

Journal code: 7807333. ISSN: 0378-5122.

AB **OBJECTIVE:** Raloxifene, a **selective estrogen receptor modulator**, is estrogen-like in the skeleton and cardiovascular system and antiestrogenic in reproductive tissues. In contrast to estrogens, raloxifene is not indicated for the treatment of **hot flashes**. This study was designed to examine the characteristics of **hot flashes** among healthy postmenopausal women participating in osteoporosis prevention trials who were receiving raloxifene or placebo. **METHODS:** Adverse event data from three randomized, double-blind trials (N = 876) comparing raloxifene 60 mg/day with placebo for 30 months were integrated and analyzed. Two of the three trials (one European, two North American) were identically designed and were open to healthy postmenopausal women ages 45 through 60 without regard to prior hysterectomy. The third trial was multinational, was open to women ages 40 through 60, and all enrollees had prior hysterectomy at baseline. Women were questioned in general terms about the occurrence of adverse events at 3-6-month intervals. Treatment-emergent adverse events pertaining to **hot flashes** were included in the current study. **RESULTS:** At baseline, 12% of women randomly assigned to placebo and 13% assigned to raloxifene reported prevalent **hot flashes**. After 30 months, the cumulative incidence of **hot flashes** was 21% for placebo and 28% for raloxifene (P = 0.022), with the difference in incidence rate confined to the first 6 months of therapy. There was no difference between placebo and raloxifene in reported maximum severity of or early discontinuations as a result of **hot flashes** (< or = 3% per group for both outcomes). Among women whose **hot flashes** had stopped completely during the 30-month study period, the median total duration of the event prior to becoming symptom-free was 246 days for placebo and 205 days for raloxifene. Among all women reporting a hot flash, the extrapolated total duration of

hot flashes was the same for women treated with either raloxifene or placebo. No subgroup-by-therapy interactions were detected. Multivariable regression analysis revealed several factors that were independently weakly predictive of hot flashes. CONCLUSIONS: Raloxifene slightly affects the incidence but not the natural history of hot flashes in healthy postmenopausal women seeking prevention therapy.

TI Antiestrogens--tamoxifen, SERMs and beyond.

AU Dhingra K

SO Investigational new drugs, (1999) Vol. 17, No. 3, pp. 285-311. Ref: 247
Journal code: 8309330. ISSN: 0167-6997.

AB Estrogens play a central role in reproductive physiology. The cellular effects of estrogens are mediated by binding to nuclear receptors (ER) which activate transcription of genes involved in cellular growth control. At least two such receptors, designated ERalpha and ERbeta, mediate these effects in conjunction with a number of coactivators. These receptors can directly interact with other members of the steroid receptor superfamily. A complex cross-talk exists between the estrogen-signaling pathways and the downstream signaling events initiated by growth factors, such as

epidermal growth factor and insulin-like growth factors. Estrogens are also a causative factor in the pathogenesis of a variety of neoplastic and non-neoplastic diseases, including breast cancer, endometrial cancer, endometriosis, and uterine fibroids, among others. Antiestrogens, such as tamoxifen, are widely used for the treatment of breast cancer. Tamoxifen produces objective tumor shrinkage in advanced breast cancer, reduces the risk of relapse in women treated for invasive breast cancer, and prevents breast cancer in high-risk women. Although, initially developed as an antiestrogen, tamoxifen can also prevent postmenopausal osteoporosis as well as reduce cholesterol, due to its estrogen-agonist effects. Its estrogen-agonist activity, however, can lead to significant side-effects such as endometrial cancer and thromboembolic phenomena. This has led to the concept of "ideal" selective estrogen receptor modulators (SERMs), drugs that would have the desired, tissue selective, estrogen-agonist or -antagonist effects. Raloxifene is a SERM which has the desirable mixed agonist/antagonist effects of tamoxifen but does not cause uterine stimulation. "Pure" antiestrogens may provide very potent estrogen-antagonist drugs, but are likely to be devoid of beneficial effects on bone and lipids. Future drug development efforts should focus on developing superior SERMs that have a greater efficacy against ER-positive tumors and do not cause hot flashes or thromboembolism, and explore combination strategies to simultaneously target hormone-dependent as well as hormone-independent breast cancer.

TI Selective estrogen receptor modulators: a controversial approach for managing postmenopausal health.

AU Curtis M G

SO Journal of women's health / the official publication of the Society for the Advancement of Women's Health Research, (1999 Apr) Vol. 8, No. 3, pp. 321-33. Ref: 151

Journal code: 9208978. ISSN: 1059-7115.

AB Hormone replacement therapy (HRT) is considered the standard of care for managing the acute (e.g., hot flashes, vaginal dryness) and long-term (e.g., increased risk of cardiovascular disease, osteoporosis) sequelae of menopause. A group of synthetic nonsteroidal compounds, which act on the estrogen receptor, have been promoted for use as an alternative to hormonal therapy for postmenopausal women. Originally called antiestrogens because of their ability to antagonize the action of estrogen, these compounds possess both agonist and antagonist properties of estrogen action. They are now referred to as **selective estrogen receptor modulators** (SERMs). This article reviews the mechanism of action and the efficacy and safety data for SERMs currently used for clinical purposes. These data may indicate why the use of SERMs is a controversial alternative to HRT.

TI Clinical effects of raloxifene hydrochloride in women.

AU Khovidhunkit W; Shoback D M

SO Annals of internal medicine, (1999 Mar 2) Vol. 130, No. 5, pp. 431-9.
Ref: 86

Journal code: 0372351. ISSN: 0003-4819.

AB PURPOSE: To review clinical data on raloxifene hydrochloride, a **selective estrogen receptor modulator** that was recently approved for the prevention of osteoporosis in postmenopausal women. DATA SOURCES: English-language articles published from 1980 to May 1998 were identified through MEDLINE searches. Bibliographies, book chapters, and meeting abstracts were reviewed for additional relevant publications. STUDY SELECTION: Publications that contained information on the background of development, structure, mechanism of action, tissue-selective effects, and adverse effects of raloxifene hydrochloride were included. DATA EXTRACTION: Data in selected articles were reviewed, and relevant clinical information was extracted. DATA SYNTHESIS: Raloxifene hydrochloride was developed in an effort to find a treatment for breast cancer and osteoporosis. It binds to the estrogen receptor and shows tissue-selective effects; thus, it belongs to a class of drugs recently described as **selective estrogen receptor modulators**. Tissue selectivity of raloxifene may be achieved through several mechanisms: the ligand structure, interaction of the ligand with different estrogen receptor subtypes in various tissues, and intracellular events after ligand binding. Raloxifene has estrogen-agonistic effects on bone and lipids and estrogen-antagonistic effects on the breast and uterus. An increase in bone mineral density at the spine, total hip, and total body has been reported with raloxifene but seems to be less than that seen with estrogen or alendronate therapy. Raloxifene has been shown to produce a reduction in total and low-density lipoprotein cholesterol concentrations similar to that produced by estrogen therapy, but high-density lipoprotein cholesterol and triglyceride concentrations do not increase during raloxifene therapy. In the uterus, raloxifene does not stimulate the endometrium. Long-term data on the effects of raloxifene in reduction of risk for fracture; prevention of cardiovascular events; cognitive function; and the incidence of breast, ovarian, and uterine cancer are not available. The most common adverse effect of raloxifene is **hot flashes**. CONCLUSIONS: Raloxifene has been shown to have beneficial effects in selected organs in postmenopausal women. Although estrogen remains the drug of choice for hormonal therapy in most postmenopausal women, raloxifene may be an alternative in certain groups of women at risk for osteoporosis.

AB The present studies evaluated the effect of estrogens and the **selective estrogen receptor modulator** (SERM) tamoxifen and raloxifene in a rat model for hot flush. In this model, ovariectomized rats were treated for 8 or 9 days either sc or po. Rats were dependent to morphine by implanting a morphine pellet (75 mg each) sc on days 3 and 5 of treatment. On the last day of treatment, a thermistor, connected to a data acquisition system, was placed on the tail of each animal and morphine addiction was withdrawn by naloxone injection (1.0 mg/kg, sc). Temperature measurements were taken for 1 h under ketamine (80 mg/kg, im) anesthesia. In general, vehicle treated rats showed a 5-6 degrees C elevation of their tail skin temperature with the peak occurring about 15 min after naloxone injection. 17 alpha-Ethinyl estradiol (EE) was evaluated both sc and po using a broad range of doses. The IC50 for inhibition of tail skin temperature rise was approximately 0.1 mg/kg, sc and 0.2 mg/kg, po. 17 beta-Estradiol and 17 alpha-estradiol were also active in this model whereas non-estrogenic steroids were inactive. Raloxifene and tamoxifen were tested for estrogen agonist and antagonist activity administered sc and po. Raloxifene did not demonstrate reproducible estrogen agonist activity at doses up to 10 mg/kg, whereas it demonstrated significant antagonistic activity at the 10 mg/kg dose regardless of the route of administration. Tamoxifen exhibited significant estrogen agonist activity at all doses tested (0.1-10.0 mg/kg) and was a significant antagonist of EE at the 1.0 mg/kg dose. Our results demonstrate the potential utility of this model to evaluate and discriminate among classes of compounds with varying degrees of estrogen agonist and antagonist activity.

AB The present studies evaluated the effect of estrogens and the **selective estrogen receptor modulator** (SERM) tamoxifen and raloxifene in a rat model for hot flush. In this model, ovariectomized rats were treated for 8 or. . .

TI Post-menopausal women and osteoporosis: available choices for maintenance of skeletal health.

AU Termine J D; Wong M

SO Maturitas, (1998 Nov 16) Vol. 30, No. 3, pp. 241-5. Ref: 42

Journal code: 7807333. ISSN: 0378-5122.

AB OBJECTIVE: To briefly summarize the therapeutic choices for osteoporosis prevention which are currently available to post-menopausal women.

METHODS: Results of randomized clinical trials and epidemiological studies in postmenopausal women, and pre-clinical studies in ovariectomized rats were summarized. RESULTS: Estrogen combined with progestogen in hormone replacement therapy (HRT) is effective in relieving perimenopausal symptoms and maintaining bone mineral density. However, the increased breast cancer risk associated with long-term HRT use makes it a less desirable option for many women. **Selective estrogen receptor modulators (SERMs)**, such as raloxifene, are also effective in maintaining bone density, without stimulating the breast or uterus. However, SERMs do not relieve perimenopausal **hot flashes**. CONCLUSION: HRT is effective for acute relief of perimenopausal symptoms, but for women who are unwilling or unable to take HRT long-term, SERMs such as raloxifene are a useful therapy for the prevention of osteoporosis.

AB . . . TI Hormone replacement therapy and breast cancer: revisiting the issues.

AU DeGregorio M W; Taras T L

SO Journal of the American Pharmaceutical Association (Washington, D.C. : 1996), (1998 Nov-Dec) Vol. 38, No. 6, pp. 738-44; quiz 744-6. Ref: 51
Journal code: 9601004. ISSN: 1086-5802.

AB OBJECTIVE: To assess current ideas about the benefits and risks of estrogen and hormone replacement therapy (ERT/HRT) in postmenopausal women. DATA SOURCES: MEDLINE searches, supplemented by various texts, of the literature on HRT, ERT, and **selective estrogen receptor modulators (SERMs)**: tamoxifen, toremifene, and raloxifene. DATA SYNTHESIS: HRT is primarily used for improving quality of life in women suffering from vasomotor symptoms associated with menopause. HRT is beneficial in postmenopausal women for preventing cardiovascular disease, osteoporosis, and Alzheimer's disease. Review of meta-analyses of clinical trials showed that ERT/HRT ever-users (patients who have ever used ERT/HRT) did not have an increased risk of breast cancer, but current users did have an increased risk, with some studies reporting increasing risk with duration of ERT. No relationship was found between dose or the addition of progestin to ERT and increased breast cancer risk. Overall breast cancer mortality rates associated with HRT were decreased in current users. In general, HRT does not increase the risk of breast cancer in women with a family history of the disease, compared with those without a family history. New HRT strategies that could potentially prevent breast cancer are now being developed. The SERMs tamoxifen and toremifene appear to have positive clinical effects on bone and serum lipids; they are currently being investigated for use as breast cancer chemopreventive agents. Raloxifene, a new SERM used for the prevention of osteoporosis, is an alternative for women who cannot tolerate HRT. Unfortunately, these SERMs have anti-estrogenic effects and thus cause vasomotor adverse effects such as hot flashes and vaginal dryness. In addition, SERMs do not protect against heart disease or prevent osteoporosis as well as does HRT. CONCLUSION: Presently, SERMs will not become first-line HRT, as the positive effects of ERT/HRT may outweigh any potentially increased risk of breast cancer. The development of new agents with pharmacodynamic profiles similar to that of ERT/HRT but lacking its adverse effects would be greatly beneficial for postmenopausal women.

AB . . . therapy (ERT/HRT) in postmenopausal women. severe problems can negatively impact quality of life. Certain women are at high risk for hot flashes following breast cancer treatment. Little research supports the safety or effectiveness of treatments in women with breast cancer. IMPLICATIONS FOR NURSING PRACTICE: Implications include the need to improve patient education, perform comprehensive symptom assessment, and counsel women about various treatment alternatives.

TI Hot flashes and their management in breast cancer.
 AB OBJECTIVE: To review literature relevant to defining and managing hot flashes in women with breast cancer. DATA SOURCES: Published literature on hot flashes in women with breast cancer and in healthy women. CONCLUSIONS: The prevalence of hot flashes is influenced by several breast cancer treatment-related factors. Hot flashes are a prevalent, severe problem that can negatively impact quality of life. Certain women are at high risk for hot flashes following breast cancer treatment. Little research supports the safety or effectiveness of treatments in women with breast cancer. IMPLICATIONS FOR...

AN 1994; 417: 1-5
 TI Tamoxifen: A review of its use in breast cancer surgery for breast cancer and tamoxifen or placebo in healthy women: different compliance with treatment
 AU Pett M A; Werlante M A; Zottar M; Magri M D; Crivellari
 SO Tamoxifen, (un) publ. 84, No. 3, pp. 372-5.
 AB AB: The purpose of this study was to investigate whether tamoxifen toxicity and side effects differed in the adjuvant versus chemoprevention setting. METHODS: At our Institutions 119 postmenopausal breast cancer patients were randomized from August 1987 to March 1995 to receive either tamoxifen 20 mg bid (n=60) or placebo (n=59) in a double-blind, placebo-controlled chemoprevention study (Prevention Study). The tamoxifen dose was 20 mg bid in both studies. Median age was 66 years (54-85) in the adjuvant study and 65 years (37-69) in the chemoprevention study. Duration was 238 and 120 weeks, respectively. RESULTS: This adjuvant studies experienced more hot flashes, and/or bleeding, bone marrow depression and weight gain than the chemoprevention study, consistent with the fact that a placebo was given in the latter study were receiving placebo. Tamoxifen toxicity occurred in 2.5% of patients in the adjuvant study and 15.1% in the chemoprevention study (difference not significant). Permanent discontinuation was more frequent in the chemoprevention study than in the adjuvant ones (26.7% vs 15.1%--P<0.05). In summary, our data show that, although the toxicity profile was similar in the two settings, a larger proportion of patients in the chemoprevention study discontinued treatment spontaneously. In the chemoprevention study, the impact of tamoxifen toxicity on compliance in the chemopreventive setting was not studied.

TI Tamoxifen for the prevention of breast cancer and tamoxifen or placebo in healthy women: different compliance with treatment

AB AIM: The study was to investigate whether tamoxifen toxicity and treatment interruptions differed in the adjuvant versus chemoprevention setting. METHODS: At our Institutions 119 postmenopausal breast cancer patients were randomized from August 1987 to March 1995 to tamoxifen in adjuvant studies (International Breast Cancer Study Group, V1 and V2) and 202 healthy hysterectomized women aged 37-77 years were randomized from November 1993 to May 1996 in a multicenter, double-blind, placebo-controlled chemoprevention study (Italian Chemoprevention Study). The tamoxifen dose was 20 mg/day for 5 years in both studies. Median age was 66 years (54-85) in the adjuvant study and 62 years (37-77) in the chemoprevention study. Median treatment duration was 100 and 110 weeks, respectively. RESULTS: Patients treated with tamoxifen in both studies experienced more hot flashes, vaginal discharge, bleeding, bone marrow depression and weight gain than those treated with placebo in the chemoprevention study, consistent with the literature. CONCLUSIONS: In summary, although the toxicity of tamoxifen is well known in both settings, a larger proportion of women is treated with tamoxifen in the chemoprevention setting. Due to the double-blind design of the chemoprevention study, the impact of the toxicity on compliance in the chemopreventive setting is not biased.

the treatment of postmenopausal hormone-dependent breast cancer. It completes the inhibition of estrogen receptors and... breast cancer cells. At concentrations $< 10^{-6}$ mol/L, this growth inhibition can be reversed. At higher concentrations toremifene is cytotoxic. In the DMBA-induced mammary cancer in rats, toremifene has been shown to decrease the number of new tumours and to inhibit the growth of existing tumours. Toremifene causes growth inhibition by inducing apoptosis and inducing apoptosis. The mechanism by which toremifene may involve the induction of transforming growth factor- β and inhibition of insulin-like growth factor-1 (IGF-1). Toremifene is primarily an antiestrogen, but it has some estrogenic effects in postmenopausal women. The latter are reflected by the rise in sex hormone-binding globulin levels. Toremifene administered orally has been found to exert a similar effect on the vaginal epithelium in postmenopausal women as does oestrogen. The half-life of toremifene in plasma is 5 days, and it is 99% bound to plasma proteins. The main metabolite of toremifene is the N-demethyl-toremifene and toremifene is excreted in the urine. Toremifene 60mg daily is as effective as tamoxifen in the treatment of postmenopausal hormone-dependent breast cancer, producing a response in about 50% of patients. So and visceral metastases respond better to toremifene than tamoxifen. Most of the adverse effects of toremifene are related to its activity at estrogen receptors and include hot flashes, dizziness, headache and nausea. Although toremifene decreases the incidence of hot flashes, the incidence of dizziness is low. Thus far, no carcinogenic effects have been observed in humans, and preclinical data are mostly reassuring. Toremifene has no effects on serum lipids, and thus has no potential for increasing the risk of coronary heart disease. Although toremifene is somewhat more effective than tamoxifen, toremifene is an effective alternative to tamoxifen in the treatment of hormone-dependent breast cancer. No formal pharmacological comparisons of toremifene and tamoxifen have yet been published. Toremifene is potentially safer than tamoxifen in relation to cardiac effects on serum lipids.

CT

*Breast Cancer: Toremifene is used for the treatment of postmenopausal hormone-dependent breast cancer. DT, drug therapy

*Toremifene: Toremifene is a selective estrogen receptor modulator (SERM) used for the treatment of postmenopausal hormone-dependent breast cancer. It is also used for the treatment of hot flashes. Toremifene is a selective estrogen receptor modulator (SERM) used for the treatment of postmenopausal hormone-dependent breast cancer. It is also used for the treatment of hot flashes.

AN 950112

TI High-dose oral ... gen and progesterone receptor negative ... Phase II trial of the Cancer and Leukemia Group B.

AU ... J ... B; Hayes D M; Duggan D B; Henderson I C

SO ... treatment, (1995) Vol. 36, No. 1, pp. 35-40.

AB ... clinical studies, high doses (> or = 200 mg/day) of the benzothiazine derivative toremifene showed activity in ER-negative and ER-unknown metastatic breast cancer patients. A mechanism of action independent of estrogen was speculated. The CALGB conducted a Phase II trial to assess the efficacy of high dose toremifene in a group of hormone receptor-negative, metastatic breast cancer patients with prior chemotherapy exposure, good performance and no prior tamoxifen. Twenty eligible patients received toremifene at 400 mg/day orally for 8 weeks. Toxicity was reported by 20% of the patients, lightheadedness by 20%, hot flashes by 15%. There was no grade 3 or 4 toxicity. Responses were observed, and 5 of 6 patients developed progressive disease at 11 to 33 weeks. Toremifene (400 mg/day) is well-tolerated but imparts effects in hormone receptor-negative, metastatic breast cancer.

AN 2005:93464 USPATFULL

TI Treatment of androgen-deprivation induced osteoporosis

PI US 2005080143 A1 20050414

CLM What is claimed is:

. a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

2. The method according to claim 1, wherein said **toremifene** is **toremifene** citrate.

3. The method according to claim 1, wherein said administering comprises administering a pharmaceutical composition comprising said **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof; and a pharmaceutically.

. a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

8. The method according to claim 7, wherein said **toremifene** is **toremifene** citrate.

9. The method according to claim 7, wherein said administering comprises administering a pharmaceutical composition comprising said **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof; and a pharmaceutically.

. a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

14. The method according to claim 13, wherein said **toremifene** is **toremifene** citrate.

. a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

17. The method according to claim 16, wherein said **toremifene** is **toremifene** citrate.

. a male human subject having prostate cancer, said method comprising the step of administering to said male human subject A **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

20. The method according to claim 19, wherein said **toremifene** is **toremifene** citrate.

. a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof

23. The method according to claim 22, wherein said **toremifene** is **toremifene** citrate.

. a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

26. The method according to claim 25, wherein said **toremifene** is **toremifene** citrate.

. a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

29. The method according to claim 28, wherein said **toremifene** is **toremifene** citrate.

31. A method of treating an androgen-deprivation induced **hot flash** in a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

32. The method according to claim 31, wherein said **toremifene** is **toremifene** citrate.

33. The method according to claim 31, wherein said administering comprises administering a pharmaceutical composition comprising said **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof; and a pharmaceutically.

37. A method of reducing the incidence of androgen-deprivation induced **hot flashes** in a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

38. The method according to claim 37, wherein said **toremifene** is **toremifene** citrate.

39. The method according to claim 37, wherein said administering comprises administering a pharmaceutical composition comprising said **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof; and a pharmaceutically.

43. A method of suppressing or inhibiting an androgen-deprivation induced **hot flash** in a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

44. The method according to claim 43, wherein said **toremifene** is **toremifene** citrate.

45. The method according to claim 43, wherein said administering comprises administering a pharmaceutical composition comprising said **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof; and a pharmaceutically.

. a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

50. The method according to claim 49, wherein said **toremifene** is **toremifene** citrate.

51. The method according to claim 49, wherein said administering comprises administering a pharmaceutical composition comprising said **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof; and a pharmaceutically.

. a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically

acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

56. The method according to claim 55, wherein said **toremifene** is **toremifene** citrate.

57. The method according to claim 55, wherein said administering comprises administering a pharmaceutical composition comprising said **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof; and a pharmaceutically. . .
a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

62. The method according to claim 61, wherein said **toremifene** is **toremifene** citrate.

63. The method according to claim 61, wherein said administering comprises administering a pharmaceutical composition comprising said **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof; and a pharmaceutically. . .
a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

68. The method according to claim 67, wherein said **toremifene** is **toremifene** citrate.

69. The method according to claim 67, wherein said administering comprises administering a pharmaceutical composition comprising said **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof; and a pharmaceutically. . .
a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

74. The method according to claim 73, wherein said **toremifene** is **toremifene** citrate.

75. The method according to claim 73, wherein said administering comprises administering a pharmaceutical composition comprising said **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof; and a pharmaceutically. . .
a male human subject having prostate cancer, said method comprising the step of administering to said male human subject a **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof.

80. The method according to claim 79, wherein said **toremifene** is **toremifene** citrate.

81. The method according to claim 79, wherein said administering comprises administering a pharmaceutical composition comprising said **toremifene** and/or its analog, derivative, isomer, metabolite, pharmaceutically acceptable salt, pharmaceutical product, hydrate, N-oxide, or any combination thereof; and a pharmaceutically. . .

AN 2005:75165 USPATFULL

TI Methods, compositions, and kits for predicting the effect of compounds

PI
CLM

on hot flash symptoms
US 2005064462 A1 20050324

What is claimed is:

1. A method for determining the effect of a candidate compound on **hot-flash** symptoms, comprising: a) contacting a first cell that expresses an estrogen receptor or estrogen related receptor with said candidate compound;. . . b) determining the effect of said candidate compound on said first cell's expression of a panel of genes associated with **hot flash** symptoms.

. . of claim 1, wherein said method further comprises comparing said first cell's expression of said panel of genes associated with **hot flash** symptoms with a reference expression profile of said panel of genes associated with **hot flash** symptoms.

. . of the panel of genes following contacting the cell with a compound selected from the group consisting of estradiol, tibolone, **raloxifene**, and **tamoxifen**.

. . of claim 1, wherein said method further comprises comparing said first cell's expression of said panel of genes associated with **hot flash** symptoms with a second cell's expression of said panel of genes associated with **hot flash** symptoms following contact with a compound that has a known effect on **hot flash** symptoms.

5. The method of claim 4, wherein said compound that has a known effect on **hot flash** symptoms is selected from the group that consists of estradiol, tibolone, **raloxifene**, and **tamoxifen**.

6. The method of claim 2 or 4, wherein said method comprises determining that said compound decreases the incidence of **hot flash** symptoms.

12. The method of claim 1, wherein said cell's expression of said panel of genes associated with **hot flash** symptoms is quantified by determining the presence and amount of mRNA expressed from said panel of genes.

13. The method of claim 12 wherein said cell's expression of said panel of genes associated with **hot flash** symptoms is quantified by a technique selected from the group of reverse transcription real time PCR, quantitative reverse transcription PCR, . . .

14. The method of claim 13, wherein said cell's expression of said panel of genes associated with **hot flash** symptoms is quantified by a multiplexed array mRNA assay.

15. The method of claim 1, wherein said cell's expression of said panel of genes associated with **hot flash** symptoms is quantified by determining the presence and amount of protein expressed from said panel of genes.

16. The method of claim 15, wherein said cell's expression of said panel of genes associated with **hot flash** symptoms is quantified by a technique selected from the group of a western blot assay, an ELISA assay, a cytokine. . . .

23. A method for rapidly determining the effects of a plurality of compounds on **hot-flash** symptoms, comprising: a) separately contacting a sample of cells that express an estrogen receptor or estrogen related receptor with each. . . . of said plurality of compounds on each of said samples of cells' expression of a panel of genes associated with **hot flash** symptoms, thereby predicting the effect of each of said compounds on **hot-flash** symptoms.

. . The method of claim 23, wherein said method further comprises comparing said expression of said panel of genes associated with **hot flash** symptoms by said samples of cells with a reference expression profile of said panel of genes associated with **hot flash** symptoms.

25. The method of claim 24, wherein said reference expression profile of said panel of genes is the expression profile. . . . of the panel of genes following contacting the cell with a compound selected from the group consisting of estradiol, tibolone, **raloxifene**, and **tamoxifen**.

The method of claim 23, wherein said method further comprises comparing said expression of said panel of genes associated with **hot flash** symptoms by said samples of cells with the expression of said panel of genes associated with **hot flash** symptoms by a sample of cells following contact with a compound that has a known effect on **hot flash** symptoms.

27. The method of claim 26, wherein said compound that has a known effect on **hot flash** symptoms is selected from the group that consists of estradiol, tibolone, raloxifene, and tamoxifen.

28. The method of claim 24 or 26, wherein said method comprises determining that said compound decreases the incidence of **hot flash** symptoms.

34. The method of claim 23, wherein said expression of said panel of genes associated with **hot flash** symptoms by said sample of cells is quantified by determining the presence and amount of mRNA expressed from said panel.

35. The method of claim 34, wherein said expression of said panel of genes associated with **hot flash** symptoms by said sample of cells is quantified by a technique selected from the group of reverse transcription real time.

36. The method of claim 35, wherein said expression of said panel of genes associated with **hot flash** symptoms by said sample of cells is quantified by a multiplexed array mRNA assay.

37. The method of claim 23, wherein said expression of said panel of genes associated with **hot flash** symptoms by said sample of cells is quantified by determining the presence and amount of protein expressed from said panel.

38. The method of claim 37, wherein said expression of said panel of genes associated with **hot flash** symptoms by said sample of cells is quantified by a technique selected from the group of a western blot assay.

surface, wherein at least one of said oligonucleotides is specific for a member of a panel of genes associated with **hot flash** symptoms, and wherein each of said different oligonucleotides is connected with said surface in a different predetermined region of said.

at least one of said oligonucleotides hybridizes under stringent conditions to a member of a panel of genes associated with **hot flash** symptoms.

TI Method of lowering body temperature with (S)-2,3-benzodiazepines

PI US 2004229866 A1 20041118

CLM What is claimed is:

13. The method according to claim 9 wherein the disorder comprises **hot flashes**.

14. The method according to claim 13 wherein said **hot flashes** occur during menopause.

15. The method according to claim 13 wherein said **hot flashes** occur during perimenopause.

16. The method of claim 13 wherein said **hot flashes** are side effects of drug therapy.

17. The method of claim 13 wherein said **hot flashes** occur subsequent to the removal of estrogen-producing tissue.

18. The method of claim 13 wherein said **hot flashes** occur subsequent to organ failure of estrogen-producing organs.

22. A method of lowering body temperature of an individual suffering from **hot flashes** associated with menopause, comprising administering to said individual an effective amount of (a) at least one compound according to Formula. . . a compound; and (b) one or more additional therapeutic agents selected from the group consisting of estrogen

agonists, progesterone agonists, **selective estrogen receptor modulators**, bisphosphonates, selective serotonin reuptake inhibitors, norepinephrine serotonin reuptake inhibitors and gamma aminobutyric acid modulators.

26. The method according to claim 22, wherein the **selective estrogen receptor modulator** agonist is selected from the group consisting of raloxifene and bazedoxifene.

. . a compound; and (b) at least one additional therapeutic agent selected from the group consisting of estrogen agonists, progesterone agonists, **selective estrogen receptor modulators**, bisphosphonates; selective serotonin reuptake inhibitors, norepinephrine serotonin reuptake inhibitors and gamma aminobutyric acid modulators.

TI Methods for treating hot flashes

PI US 2004214898 A1 20041028

CLM What is claimed is:

1. A method of treating a subject with **hot flashes**, said method comprising the step of administering to said subject a **selective estrogen receptor modulator (SERM)** and/or its pharmaceutically acceptable salt, hydrate, N-oxide, or any combination thereof.

2. The method according to claim 1, wherein said **SERM** is Toremifene.

5. The method according to claim 1, wherein said **SERM** is administered

at a dosage of about 20 mg per day.

6. The method according to claim 1, wherein said **SERM** is administered at a dosage of about 40 mg per day.

7. The method according to claim 1, wherein said **SERM** is administered at a dosage of about 60 mg per day.

8. The method according to claim 1, wherein said **SERM** is administered at a dosage of 80 mg per day.

9. A method of suppressing, inhibiting or reducing the risk of **hot flashes**, said method comprising the step of administering to said subject a **SERM** and/or its pharmaceutically acceptable salt, hydrate, N-oxide, or any combination thereof.

10. The method according to claim 9, wherein the **SERM** is **Toremifene**.

13. The method according to claim 9, wherein said **SERM** is administered at a dosage of about 20 mg per day.

14. The method according to claim 9, wherein said **SERM** is administered at a dosage of about 40 mg per day.

15. The method according to claim 9, wherein said **SERM** is administered at a dosage of about 60 mg per day.

16. The method according to claim 9, wherein said **SERM** is administered at a dosage of 80 mg per day.

TI Methods for treating hot flashes and gynecomastia

PI US 2004213841 A1 20041028

CLM What is claimed is:

1. A method of treating a subject with **hot flashes**, said method comprising the step of administering to said subject an anti-estrogen agent and/or its pharmaceutically acceptable salt, hydrate, N-oxide, .

2. The method according to claim 1, wherein said anti-estrogen is a **selective estrogen receptor modulator (SERM)**.

3. The method according to claim 1, wherein said anti-estrogen is a **triphenylethylene**.

4. The method according to claim 1, wherein said anti-estrogen is **Toremifene**.

7. The method according to claim 1, wherein said **antiestrogen** is administered at a dosage of about 20 mg per day.

8. The method according to claim 1, wherein said **antiestrogen** is administered at a dosage of about 40 mg per day.

9. The method according to claim 1, wherein said **antiestrogen** is administered at a dosage of about 60 mg per day.

10. The method according to claim 1, wherein said **antiestrogen** is administered at a dosage of 80 mg per day.

11. A method of suppressing, inhibiting or reducing the risk of **hot flashes**, said method comprising the step of administering to said subject an anti-estrogen agent and/or its pharmaceutically acceptable salt, hydrate, N-oxide, .

12. The method according to claim 11, wherein the anti-estrogen is a **selective estrogen receptor modulator (SERM)**.

13. The method according to claim 11, wherein the anti-estrogen is a **triphenylethylene**.

14. The method according to claim 11, wherein the anti-estrogen is **Toremifene**.
17. The method according to claim 11, wherein said **antiestrogen** is administered at a dosage of about 20 mg per day.
18. The method according to claim 11, wherein said **antiestrogen** is administered at a dosage of about 40 mg per day.
19. The method according to claim 11, wherein said **antiestrogen** is administered at a dosage of about 60 mg per day..
20. The method according to claim 11, wherein said **antiestrogen** is administered at a dosage of 80 mg per day.
22. The method according to claim 21, wherein said anti-estrogen is a **selective estrogen receptor modulator (SERM)**.
23. The method according to claim 21, wherein said anti-estrogen is a **triphenylethylene**.
24. The method according to claim 21, wherein said anti-estrogen is **Toremifene**.
27. The method according to claim 21, wherein said **antiestrogen** is administered at a dosage of about 20 mg per day.
28. The method according to claim 21, wherein said **antiestrogen** is administered at a dosage of about 40 mg per day.
29. The method according to claim 21, wherein said **antiestrogen** is administered at a dosage of about 60 mg per day.
30. The method according to claim 21, wherein said **antiestrogen** is administered at a dosage of 80 mg per day.
32. The method according to claim 31, wherein the anti-estrogen is a **selective estrogen receptor modulator (SERM)**.
33. The method according to claim 31, wherein the anti-estrogen is a **triphenylethylene**.
34. The method according to claim 31, wherein the anti-estrogen is **Toremifene**.
37. The method according to claim 31, wherein said **antiestrogen** is administered at a dosage of about 20 mg per day.
38. The method according to claim 31, wherein said **antiestrogen** is administered at a dosage of about 40 mg per day.
39. The method according to claim 31, wherein said **antiestrogen** is administered at a dosage of about 60 mg per day.
40. The method according to claim 31, wherein said **antiestrogen** is administered at a dosage of 80 mg per day.

AN 2004:197427 USPATFULL
 TI Duloxetine for treatment of hot flashes
 PI US 2004152733 A1 20040805
 CLM What is claimed is:

1. A method of treating **hot flashes** in a mammal comprising administering to a mammal in need thereof an effective amount of duloxetine.
5. Duloxetine for use in the treatment of **hot flashes**.
6. A pharmaceutical formulation containing, as an active ingredient, duloxetine adapted for use in the treatment of **hot flashes**.

7. The use of duloxetine for the manufacture of a medicament for the treatment of **hot flashes**.
8. A method of treating **hot flashes** in a human undergoing **raloxifene** administration comprising administering an effective amount of duloxetine to a human in need thereof.
9. The method according to claim 7 where the **raloxifene** is **raloxifene hydrochloride**.
10. The method according to claim 7 where the administration of duloxetine and **raloxifene** is concurrent.
11. The method according to claim 9 where the administration of duloxetine and **raloxifene** is simultaneous.
12. The use of duloxetine for the manufacture of a medicament for treating **hot flashes** in a human female undergoing **raloxifene** administration.
13. A pharmaceutical formulation adopted for treatment of **hot flashes** in humans comprising duloxetine and **raloxifene**.
14. A method of treating **hot flashes** in a human undergoing estrogen replacement therapy comprising administering an effective amount of duloxetine to a human in need thereof.
17. The use of duloxetine for the manufacture of a medicament for treatment of **hot flashes** in a human female undergoing estrogen replacement therapy.
18. A pharmaceutical formulation adopted for treatment of **hot flashes** in humans comprising duloxetine and estrogen replacement therapy.
19. A method of treating **hot flashes** in a human female comprising administering to a woman in need thereof an effective amount of duloxetine estrogen replacement therapy.
20. The use of duloxetine for the manufacture of a medicament for treatment **hot flashes** in a human female where estrogen replacement therapy is contraindicated.

AN 2003:93647 USPATFULL
 TI Selective estrogen receptor modulators in combination with estrogens

CLM What is claimed is:

1. A method of treating or reducing the risk of acquiring a condition selected from the group consisting of osteoporosis, . . . amount of an estrogen or prodrug thereof in association with administering to said patient a therapeutically effective amount of a **selective estrogen receptor modulator** or prodrug thereof, said modulator having the following formula: ##STR12## wherein R_1 and R_2 are independently hydrogen, hydroxyl or a . . .

. . . amount of an estrogen or prodrug thereof in association with administering to said patient a therapeutically effective amount of a **selective estrogen receptor modulator** or prodrug thereof, said modulator being a different compound from said estrogen and being a different compound from a benzothiophene. . .

. . . amount of an estrogen or prodrug thereof in association with administering to said patient a therapeutically effective amount of a **selective estrogen receptor modulator** or prodrug thereof, said modulator being a different compound from said estrogen, further comprising the step of administering, as part. . .

5. The method of claim 4, wherein the **selective estrogen receptor modulator** has a molecular formula with the following features: a) two aromatic rings spaced by 1 to 2 intervening carbon atoms, . . .

7. The method of claim 5, wherein the **selective estrogen receptor modulator** is selected from the group consisting of a **triphenylethylene** derivative, benzopyran derivative, HMR 3339, HMR 3656, LY 335124, LY 326315, SH 646, ERA 923 and centchroman derivative.

8. The method of claim 5, wherein the **selective estrogen receptor modulator** is a **triphenylethylene** or diphenylhydronaphthalene derivative compound of the following formula: ##STR15## wherein D is --OCH₂CH₂N(R₃)R₄, --OCH₂CH₂OH, or --CH₂dbd.CH--COOH (R₃ and R₄ either. . .

9. The method of claim 1, wherein **selective estrogen receptor modulator** is selected from the group consisting of OH-tamoxifen, Droloxifene, Toremifene, Iodoxifene, Lasofoxifene, iproxifene, FC 1271, and GW5638.

10. The method of claim 5, wherein the **selective estrogen receptor modulator** is a centchroman derivative compound of the following formula: ##STR16## wherein R_1 and R_2 are independently selected from the group. . .

12. The method of claim 5, wherein the **selective estrogen receptor modulator** has the following formula: ##STR17## wherein R_1 and R_2 are independently hydrogen, hydroxyl or a moiety which is converted to. . .

16. The method of claim 14, wherein said **selective estrogen receptor modulator** is selected from the group consisting of: ##STR21## wherein all of the foregoing molecular structures whose stereochemistry is indicated are. . .

19. The method claim 1, wherein said **selective estrogen receptor modulator** is: ##STR22## and is optically active due to a majority of its stereoisomers being of 2S configuration; and wherein the. . .

21. The method of claim 1, wherein the **selective estrogen receptor modulator** has no estrogenic activity in breast or endometrium tissues.

24. The method of claim 1, wherein menopausal symptoms are selected from the group consisting of **hot flashes**, vasomotor symptoms, irregular menstruation, vaginal dryness, headache and sleep disturbance.

26. The method of claim 2, wherein the **selective estrogen receptor modulator** has a molecular formula with the following features: a) two aromatic rings spaced by 1 to 2 intervening carbon atoms, . . .

28. The method of claim 26, wherein the **selective estrogen receptor modulator** is selected from the group consisting of a **triphenylethylene** derivative, benzopyran derivative, HMR 3339, HMR 3656, LY 335124, LY 326315, SH 646, ERA 923 and centchroman derivative.

29. The method of claim 26, wherein the **selective estrogen receptor modulator** is a **triphenylethylene** or diphenylhydronaphthalene derivative compound of the following formula: ##STR24## wherein D is --OCH₂CH₂N(R₃)R₄, --OCH₂CH₂OH, or --CH₂dbd.CH--COOH (R₃ and R₄ either.

30. The method of claim 2, wherein **selective estrogen receptor modulator** is selected from the group consisting of OH-tamoxifen, Droloxifene, Toremifene, Iodoxifene, Lasofoxifene, iproxifene, FC 1271, and GW5638.

31. The method of claim 26, wherein the **selective estrogen receptor modulator** is a centchroman derivative compound of the following formula: ##STR25## wherein R_1 and R_2 are independently selected from the group.

33. The method of claim 26, wherein the **selective estrogen receptor modulator** has the following formula: ##STR26## wherein R_1 and R_2 are independently hydrogen, hydroxyl or a moiety which is converted to.

37. The method of claim 35, wherein said **selective estrogen receptor modulator** is selected from the group consisting of: ##STR29## wherein all of the foregoing molecular structures whose stereochemistry is indicated are.

40. The method claim 2, wherein said **selective estrogen receptor modulator** is: ##STR30## and is optically active due to a majority of its stereoisomers being of 2S configuration; and wherein the.

42. The method of claim 2, wherein the **selective estrogen receptor modulator** has no estrogenic activity in breast or endometrium tissues.

45. The method of claim 2, wherein menopausal symptoms are selected from the group consisting of **hot flashes**, vasomotor symptoms, irregular menstruation, vaginal dryness, headache and sleep disturbance.

47. The method of claim 1, wherein said condition is hyperlipidemia, said **selective estrogen receptor modulator** is EM-652.HCl and said estrogen is 17 β -estradiol.

48. The method of claim 4, wherein said condition is hyperlipidemia, said **selective estrogen receptor modulator** is EM-652.HCl, said estrogen is 17 β -estradiol and said additional agent is dehydroepiandrosterone.

TI Selective estrogen receptor modulators in combination with estrogens

PI US 2003040510 A1 20030227

CLM What is claimed is:

. amount of an estrogen or prodrug thereof in association with administering to said patient a therapeutically effective amount of a **selective estrogen receptor modulator** or prodrug thereof, said modulator being a different compound from said estrogen and not being a benzothiophene or a phenylindole.

. amount of an estrogen or prodrug thereof in association with administering to said patient a therapeutically effective amount of a **selective estrogen receptor modulator** or prodrug thereof, said modulator being a different compound from said estrogen and not being a phenylindole derivative, further comprising.

4. The method of claim 1, wherein the **selective estrogen receptor modulator** has a molecular formula with the following features: a) two aromatic rings spaced by 1 to 2 intervening carbon atoms,.

6. The method of claim 4, wherein the **selective estrogen receptor modulator** is selected from the group consisting of a triphenylethylene derivative, benzopyran derivative, HMR 3339, HMR 3656, LY 335124, LY 326315, SH 646, ERA 923 and centchroman derivative.

7. The method of claim 8, wherein the **selective estrogen receptor modulator** is a benzothiophene derivative compound of the following formula: ##STR13## wherein R_1 and R_2 are independently selected from the group.

8. The method of claim 7, wherein the **selective estrogen receptor modulator** is selected from the group consisting of Raloxifene, LY 353381 and LY 335563.

9. The method of claim 4, wherein the **selective estrogen receptor modulator** is a triphenylethylene or diphenylhydronaphthalene

derivative compound of the following formula: ##STR14## wherein D is --OCH₂CH₂N(R₃)R₄, --OCH₂CH₂OH, or --CH₂CH₂COOH (R₃ and R₄ either. . . .
10. The method of claim 1, wherein **selective estrogen receptor modulator** is selected from the group consisting of OH-tamoxifen, Droloxifene, Toremifene, Iodoxifene, Lasofoxifene, iproxifene, FC 1271, and GW5638.

11. The method of claim 4, wherein the **selective estrogen receptor modulator** is a centchroman derivative compound of the following formula: ##STR15## wherein R₁ and R₂ are independently selected from the group. . . .

13. The method of claim 4 wherein the **selective estrogen receptor modulator** has the following formula: ##STR16## wherein R₁ and R₂ are independently hydrogen, hydroxyl or a moiety which is converted to. . . .

17. The method of claim 15, wherein said **selective estrogen receptor modulator** is selected from the group consisting of: ##STR19## wherein all of the foregoing molecular structures whose stereochemistry is indicated are. . . .

20. The method claim 1, wherein said **selective estrogen receptor modulator** is: ##STR20## and is optically active due to a majority of its stereoisomers being of 2S configuration; and wherein the. . . .

22. The method of claim 1, wherein the **selective estrogen receptor modulator** has no estrogenic activity in breast or endometrium tissues.

25. The method of claim 1, wherein menopausal symptoms are selected from the group consisting of **hot flashes**, vasomotor symptoms, irregular menstruation, vaginal dryness, headache and sleep disturbance.
